### Instrument List:

- [Yellow](#)

Discussion:

NPOL scanning was terminated at 1315 UTC to investigate a creaking sound in the AZ or EL motors during volume scans. At this point, there does not seem to be reason for alarm, as we are just being proactive. During this outage, engineers have also adjusted the pointing angle by +0.1 degree to better align with Sun. A solar cal will also be performed and applied, if necessary when the radar resumes operations.
