### Instrument List:

- [Green](#)

Discussion:

Spotty showers were present during the day in different domains around the radar. A small linear feature progressed through the southeast domain but remained beyond the range of the D3R radar. Later at night, the weak spotty showers continued as a line of storms formed along the east/west boundary in southern Iowa. This line was out of range of the radar, however and produced some interesting second trip echoes at NPOL.
