Discussion:

Waiting for convection to pop this evening- hopefully only a matter of time. A little trying along fine line to the SW-NE of us (plainly visible on display).

NPOL scans are done and working fine. Cals completed (SWR1.24/1.25 H and V- in spec!). Few minor networking issues to get taken care of but we are basically ready to start when the rain does. Dave will push out imagery tomorrow.

Patrick and Marta stopped by NPOL/D3R this afternoon and reported that all disdro/gauge instruments looked to be in good shape.

XPOL was being deployed to northern Turkey River site today. The other will go to southern site tomorrow.

Forecast is still wet (and cold) for next few days so, we should get a shot at decently long data collection to kick off the campaign.
