Sunday, May 19, 2013 - 19:15

Discussion:

The IFLOODS domain has been relatively free of precipitation today, at least compared to what has been happening around us. At this time a few weak storms are 75 km to the south. Lots of convection off to the west around KDSM. We obtained 10 minutes of coordinated D3R/N-pol data way back at 2010 UTC today. We are still hopeful that IFLOODS will get some good data tonight.
