

Plan of the Day for Tuesday, 4 June 2013

Submitted by tjlang on Tue, 06/04/2013 - 09:38

Date:

Tuesday, June 4, 2013 - 09:30

Discussion:

NPOL/D3R will continue coordinated scanning on the stratiform rain event in our domain. XPOLs 2 and 4 also should have significant precipitation in their range right now, and for the foreseeable future. XPOL-3 is scanning as well, and XPOL-5 will be available shortly. All surface instrumentation is functioning normally except for APU07. Today should continue to be very active for IFloodS, though we expect less overall rainfall than many of the superlative events from last week.
