

Monday (April 4) Forecast

Submitted by dhartsock on Mon, 04/04/2011 - 10:23

- [Central Facility](#)

A cold front moved through the region overnight, with a line of thunderstorms over the eastern half of OK. A deck of low-level clouds is moving through post frontal and expected to clear out later today. An upper-level ridge will begin to build in and progress over the area the next few days, bringing mostly dry and clear conditions. A few mid-to-upper level clouds will be possible through the week. But the next best chance for precipitation will not likely be until Friday night into Saturday as a long wave trough develops out West.

Forecasts

Time of Day:

Morning

Day 0:

04/04/2011

Forecast for Day 0:

A low cloud deck with some isolated sprinkles is possible this morning. By noon, should be clearing out as strong NNW winds move in behind the front. Should be mostly clear the rest of the day.

Day 1:

04/05/2011

Forecast for Day 1:

Tuesday should remain mostly sunny and clear at the Central Facility as we remain under a NW flow aloft under the upper-level ridge.

Day 2:

04/06/2011

Forecast for Day 2:

Wednesday will continue to remain dry. Though a few mid-to-upper level clouds may move over the region as the upper level winds begin to shift to more Westerly and SW. A cut-off low over the SW pacific will interact with the sub-tropical jet possibly bringing in some upper-level moisture. Later evening into Thursday, winds at 500 mb (6km) will be 40-50 knots WSW.

Extended Outlook:

The NWS is saying slight chances remain for thunderstorms in the forecast for late this week into the weekend as a long-wave trough progresses from the West.
